Assignment 5

A large company with *n* employees has a scheme according to which each employee buys a Christmas gift and the gifts are then distributed at random to the employees. Simulate this process over **10,000 trials** to estimate the probability that at least *j* ($j \leq n$) employees receive their own gift.

Note that, *n* & *j* will be assigned by the user, also code should be written using *class*.
